### Explanation:

As it can be seen on the burndown chart, we assigned most tasks by July 5th. As each person was assigned to put their own tasks on Jira, the entire team finished putting all the tasks by July 7th. Our first completed task was on July 6th when we finished MJAAR-95. We then continued finishing user stories right up until July 16 where we finished MJAAR-92. Our chart does not reach the bottom x-axis because we were unable to finish one story (MJAAR-93).

Compared to the last sprint, we assigned more stories which corresponded to slightly less total story points. When comparing the user stories with last sprint's we can clearly see that this time, we managed to develop 7 different user stories, and a total of 6 complete features. Conversely, last sprint, we managed to only finish 5 features.

By looking at the velocity report, we managed to complete 35 story points, compared to 39 story points for sprint 2.

Unlike last sprint, this sprint our burndown chart starts off at a high point instead of slowly reaching a maximum. This is because we made sure to start the sprint early and get everyone to add all of the tasks. Likewise, our chart declined much less steeply which shows that we slowly completed our tasks as time went on.
